

Student Budget Tracker

Recovered readable source from the uploaded Python .pyc modules

The uploaded files are Python 3.14 compiled bytecode. Exact decompilation was not available in this runtime, so this PDF presents a readable reconstruction based on the compiled modules' function names, variables, prompts, constants and structure.

module1.cpython-314.pyc

```
# Student Budget Tracker - Module 1
```

```
def student_details():
    print("enter name")
    n = input()
    print("enter course")
    c = input()
    print("enter year")
    y = input()
    return n, c, y
```

```
def get_income():
    print("pocket money")
    p = float(input())
    print("scholarship")
    s = float(input())
    print("job money")
    j = float(input())
    t = p + s + j
    print("total income")
    return p, s, j, t
```

module2.cpython-314.pyc

Student Budget Tracker - Module 2

```
def get_expenses():
    print("food expense")
    f = float(input())
    print("books")
    b = float(input())
    print("travel")
    tr = float(input())
